The foundation of the density-functional tight-binding (DFTB) method is briefly reviewed. The approximations of the DFTB within the Kohn-Sham density functional theory (KS-DFT) are critically evaluated. We present a DFTB approach based on a self-consistent field (SCF) framework beyond the original second order self-consistent charge (SCC) DFTB. Several corrections are described and evaluated on selected test systems. The relation to traditional semiempirical quantum chemical methods is outlined.
